Characteristics

Remark:

The reference level for the relative attenuation a_{rel} of the TFS 1220 is the minimum of the pass band attenuation a_{min} . The minimum of the pass band attenuation a_{min} is defined as the insertion loss a_e . The centre frequency f_c is the arithmetic mean value of the upper and lower frequencies at the 3 dB filter attenuation level relative to the insertion loss a_e . The nominal frequency f_N is fixed at 1220,0 MHz without any tolerance. The given values for both the relative attenuation a_{rel} and the group delay ripple have to be achieved at the frequencies given below even if the centre frequency f_c is shifted due to the temperature coefficient of frequency TC_f in the operating temperature range and due to a production tolerance for the centre frequency f_c .

$f_N \pm 6$ MHz	$f_N \pm 20$ MHz	37	dB	min. 14 dB
$f_N + 20$ MHz	$f_N + 180$ MHz	35	dB	min. 30 dB
$f_N - 20$ MHz	$f_N - 1150$ MHz	45	dB	min. 30 dB
Input power level				max. 10 dBm

Operating temperature range				- 40 °C ... + 85 °C
Storage temperature range				- 45 °C ... + 90 °C

*) The terminating impedances depend on parasitics and q-values of matching elements and the board used, and are to be understood as reference values only. Should there be additional questions do not hesitate to ask for an application note or contact our design team.

***) $\Delta f_c(\text{Hz}) = TC_f(\text{ppm/K}^2) \times (T - T_a)^2 \times f_{CAT}(\text{MHz})$
